EMCO

emcoair **ventilation systems**

In 1972 emco klima was launched to produce a series of best quality air diffusers.
Continuous development of products for various different air delivery systems and their ‚on-time' despatch, gradually secured the creation of well earned trust between emco and the consultant specifiers, contractors and end users.
emco klima also offers ‚In-house' services that include laboratory testing, computer analysis and product selection during the planning process, to provide functional dependability and optimum economic efficiency for the entire range of air and water based systems.
emco klima has noticed a significant change in clients requirements.
The reason being increased sales of other products such as emcotherm convectors for heating and emcocool chilled ceiling systems, where water is the means of energy transportation.
Reduced electrical energy for water circulation is one of the major driving forces behind market changes, in addition to changes in construction methods and artistic challenges.

emcoair **grilles**

emcoair grilles are used in all applications of classic ventilation and heating technology in which discharge openings in the floor, wall and ceiling should be covered in an aesthetically please yet functional manner. emco's entire range of grilles is available in a variety of colours to best adapt to the interior and in most cases, they are also available as linear grilles.

Our grilles are highly valued and have been used for years in other sectors, such as the furniture industry, because of their versatility and high quality. One more reason why emco leaves nothing to chance, not even in the production of basic standard products.

Series 320

Series 310

Opening

Within the field of climate control, air conditioning is becoming increasingly important.

Before now, creating a comfortable space was all that mattered, which meant implementing draught-free air feeds in a way that took spatial, thermal and velocity-related considerations into account. Today, however, we are given the extra challenge of ensuring these requirements are met from an energy-saving perspective. A key factor in achieving this is to not only look at the overall design concept for a system, but also to select the right fan grilles, make the right calculations for them and ensure they meet the right requirements.

The details of the versions on the pages that follow are intended to provide the user of these technical documents with information about the key types of airflows and the criteria for them, as well as the characteristics they demonstrate. They are also designed to help the user determine the right dimensions and choose the products that best meet the needs of the application, with the aid of selection diagrams.

Each of the individual diagrams is accompanied by examples that enable users to get to grips with products quickly and easily.

However, we are very happy to answer any questions you might have. We would also be delighted to receive any suggestions for improvements or other information.

The selection diagrams reflect the characteristics of airflows that are able to disperse through rooms unhindered after exiting a fan grille.

The flow characteristics of airflows that enter rooms with limited space are affected by:

- The shape of the room
- Where the supply air openings are situated, how many there are and their shape
- The difference in temperature between the supply air and the air in the room
- Fixtures in the room that hinder the airflow
- Heat sources that emit their own airflows (radiators, fans, etc.)

To ensure you achieve reliable results when using the diagrams in this document, we recommend a supply air volume flow that produces a basic air change rate of Lw > 3 [1/h].

Additionally, the ratio of room height to room depth (room depth = main flow direction of air introduced into room) must not exceed l/h < 4 to 4.5.

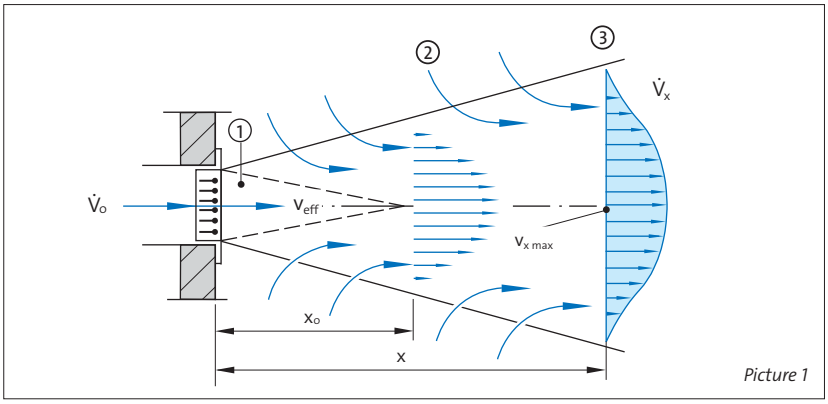
Room airflow / Basics / Method of operation

Picture 1

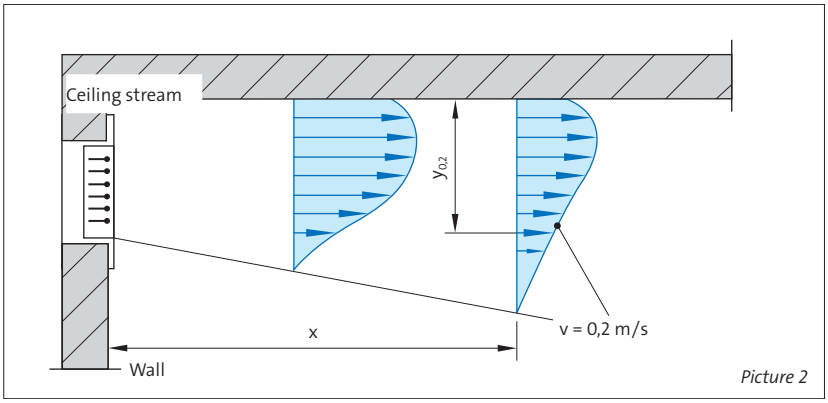
The picture shows the flow pattern of an isothermal open jet (i.e. airflow temperature and room air temperature are at the same level).
In the core flow (1; primary air) with length x_0, the open jet retains its original velocity. At the interface between the flowing and static air, air type 2 (secondary air) is also led out of the room as a result of friction. Swirling in the zone where the air types mix (3) causes the velocity at which the airflow exits the grille (v_{eff}) to fall to velocity v_{max}. Here, the total volume flow in the airflow ($\dot{V}_x$) is made up of the secondary and primary air.



Picture 1

Picture 2

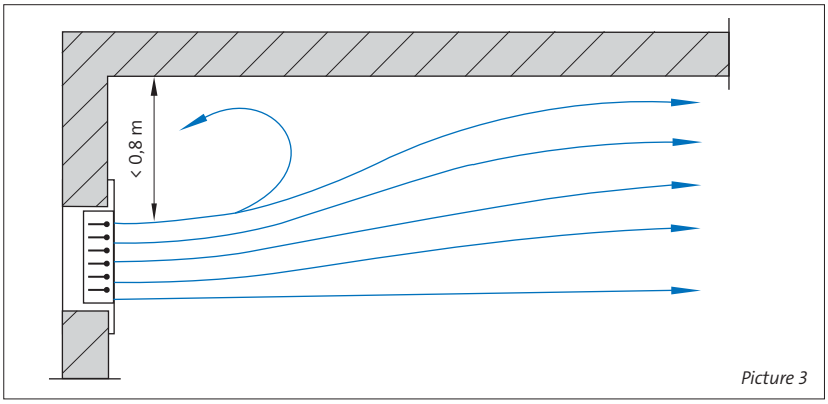
If a ventilation grille is integrated into a side wall immediately beneath the ceiling, then the air flows towards the ceiling. There is less of a drop in velocity in the ceiling airflow than in the open jet, which creates a longer airflow path x (trajectory length).
$y_{0.2}$ is the distance from the airflow axis (open jet) or ceiling (ceiling airflow) at which the velocity v ≈ 0.2 m/s.



Picture 2

Picture 3

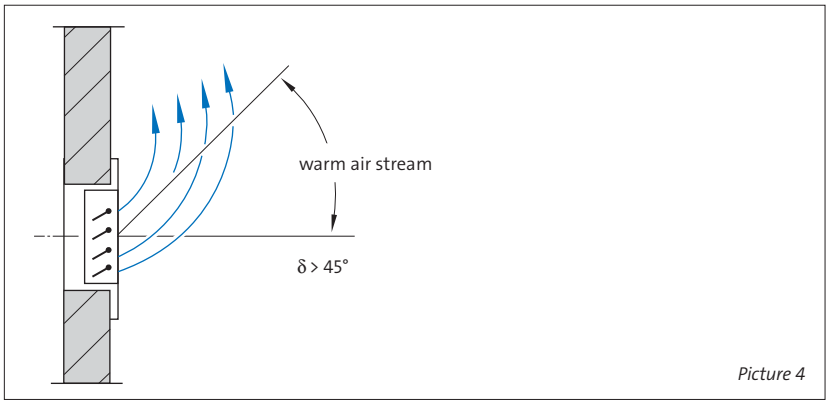
If a ventilation grille integrated into a side wall is more than 0.8 m away from the ceiling, the air that escapes will flow towards the ceiling after a certain distance (Coanda effect).
This also creates a longer airflow path x (trajectory length).



Picture 3

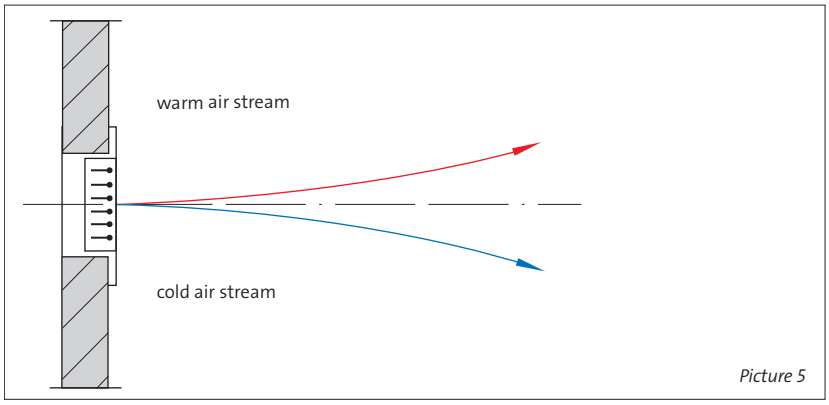
Room airflow / Basics / Method of operation

Picture 4
If the ventilation grille diverts an airflow at an angle of δ > 45°, the air will flow towards the wall where the grille is installed.
The properties of the airflow may also be transferred to the wall and floor in the case of ventilation grilles installed in the same way.



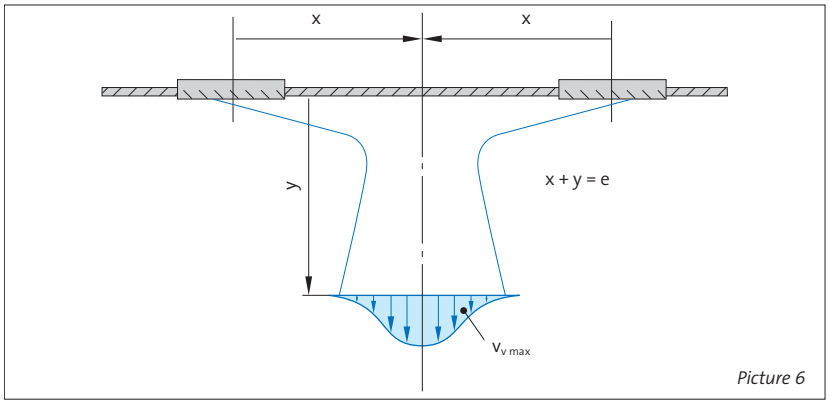
Picture 4

Picture 5
The airflow is affected by not only structural and spatial factors, but also thermal buoyant and output forces. The picture shows a diagram of the direction in which a non-isothermal open jet (i.e. airflow temperature and room air temperature are not at the same level) tends to flow. (See also diagrams “Vertical airflow diversion y (m) due to temperature differences” and “Descent of the ceiling airflows during the cooling operation”).



Picture 5

Picture 6
If two ceiling airflows meet, the max. vertical airflow velocity equals $v_{v\,max}$ after the airflow path x + y = e.



Picture 6

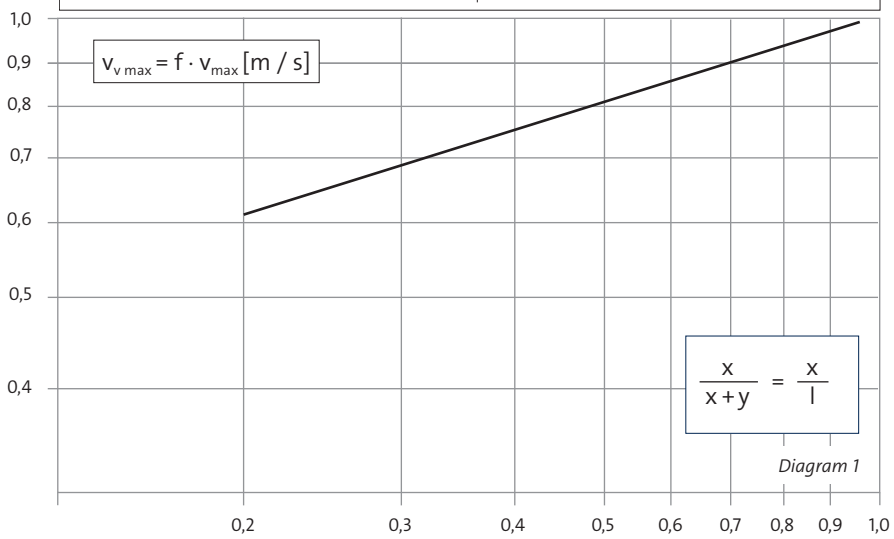


Diagram 1

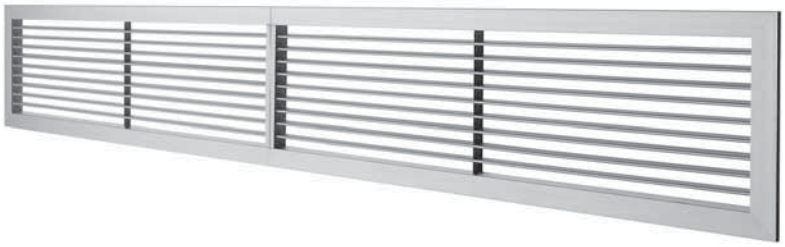

Supply and Exhaust Air Grille G 311
Supply and Exh. Linear Air Grille GB 311

With adjustable aluminium blades in a natural anodized finish (E6C0). Horizontal, individually adjustable front blades. Standard attachments in galvanized material with black baked-finish.
Attached to the subframe with concealed revolving interlock device or recessed screws in the frame.

Supply and Exh. Linear Air Grille GB 311

emcoair linear grilles are available in installation-friendly normed sections in the heights 125, 225 and 325 mm. The intermediate sections (“M“) have a fixed length of 1220 mm and the two end sections (”E“) are adjusted to the overall length of the linear grille.
The length of the end sections vary between 500 mm and 1220 mm so that the linear grille could be made up of two end sections.
Standard and special attachments (as per part no.) such as flow rate damper, flap damper, control damper, normal or angled hit-and-miss damper: see cap. emcoair grilles standard- and special attachments.

Supply and Exhaust Air Grille G 311

Ventilation Grille G 341
Ventilation grille in a solid, impact-resistant construction (DIN 18032). Standard attachments in galvanized material with black baked-finish. Blades and frame in a natural anodized finish (E6C0). Blade spacing 8 or 12 mm. Attached to the frame with recessed holes in the frame for screw mounting.

Linear Ventilation Grille GB 341
341 emco linear grilles are available in installation-friendly normed sections in the heights 125, 225 and 325 mm. The intermediate sections ("M") have a fixed length of 2020 mm and the two end sections ("E") are adjusted to the overall length of the linear grille.

Standard and special attachments such as flow rate and control damper: see cap. emcoair grilles standard and special attachments.

Installation dimensions with subframe:
H/W = cutout size
Installation dimensions without subframe: H/W – 8 mm = cutout size

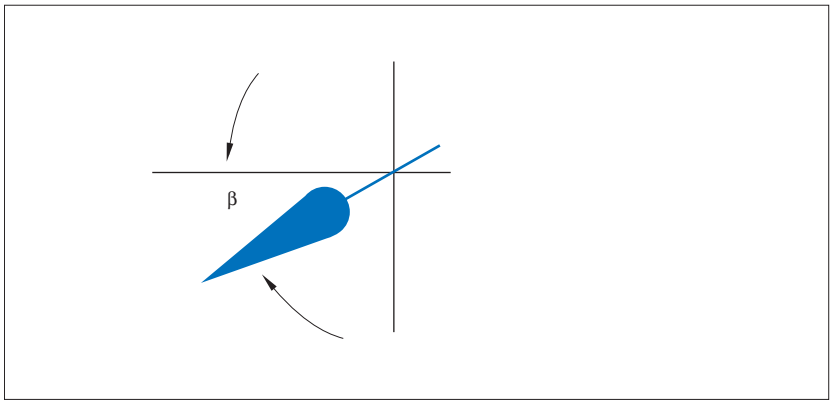
Rating:

Airflow spread and division

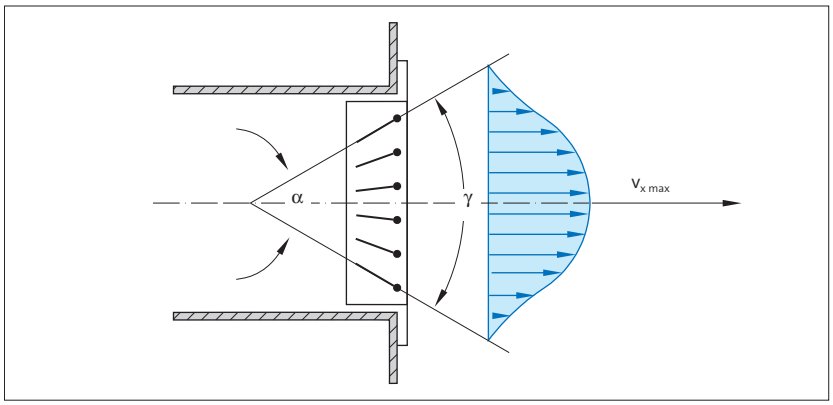
An airflow spread or airflow division can be obtained by means of the adjustment of the front slats of a grille. In this process the airflow path x, the velocity $v_{x\,max}$ in the centre of the airflow and the pressure drop Δp_t is altered depending on the slat angle of incidence β.



Airflow spread

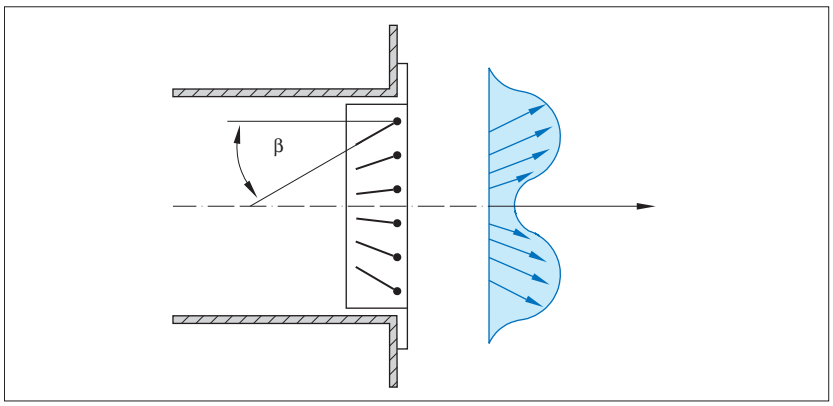
Constantly diverging slats from interior outwards.

Grille aperture angle α	45°	90°
Airflow aperture angle γ	40°	70°



Airflow division

Half of the slats respectively with the same positive or negative angle of incidence β. The airflow is divided into two partial airflows.

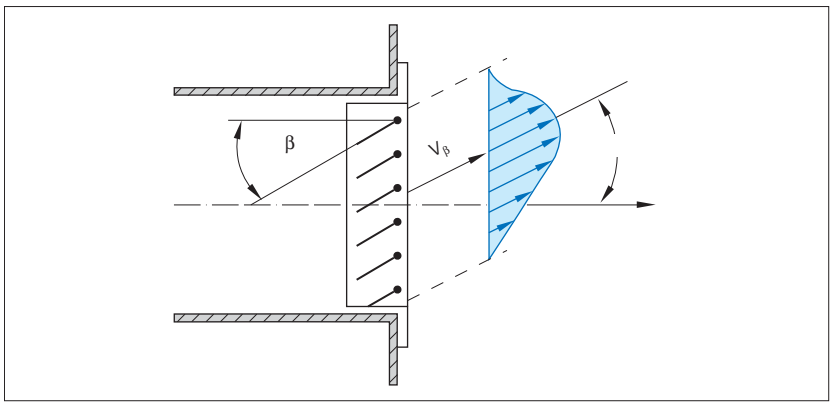


All the slats with the same angle of incidence β

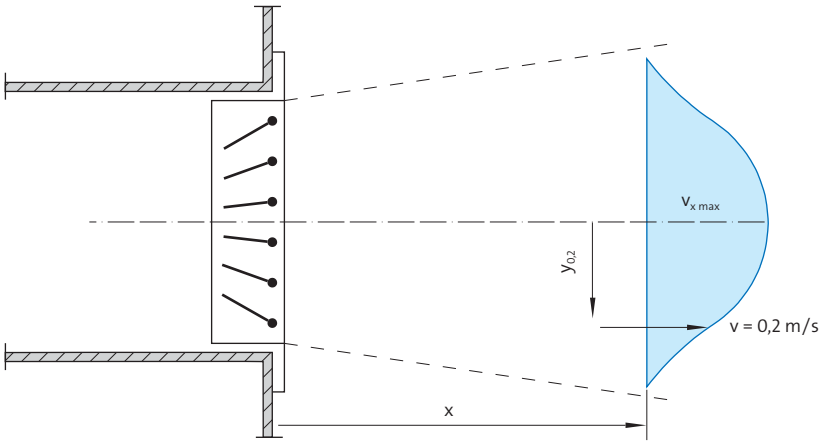
The angle of deflection δ approximately equates to the slat of incidence β (δ ≈ β). The air outgoing speed v_β is greater during the airflow guidance than v_{eff}.

β	0°	15°	30°	45°
K	1,0	1,04	1,15	1,41

$$v_\beta = K \cdot x \cdot v_{eff} \qquad v_{eff} = \frac{\dot{V}_o}{A_{eff}}$$

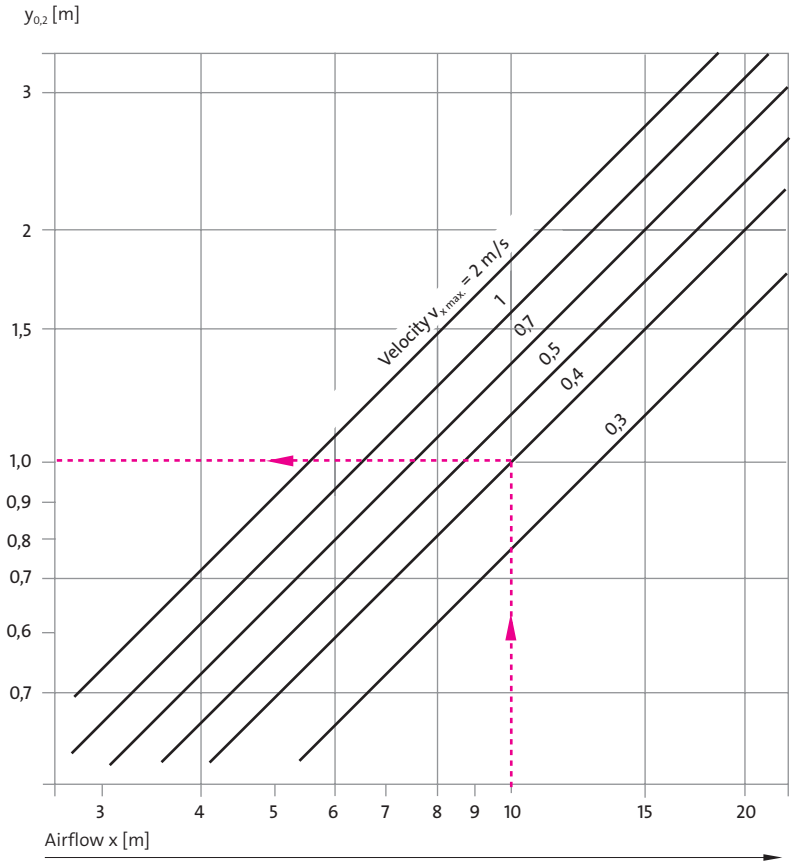


Rating diagrams



Minimum spacing of grilles

Distance from the airflow axis $y_{0.2}$ of an open jet, at which the velocity v ≈ 0,2 m/s. The diagram opposite also applies to ceiling airflows. $y_{0.2}$ therefore specifies the distance from the ceiling at which the velocity v ≈ 0.2 m/s.



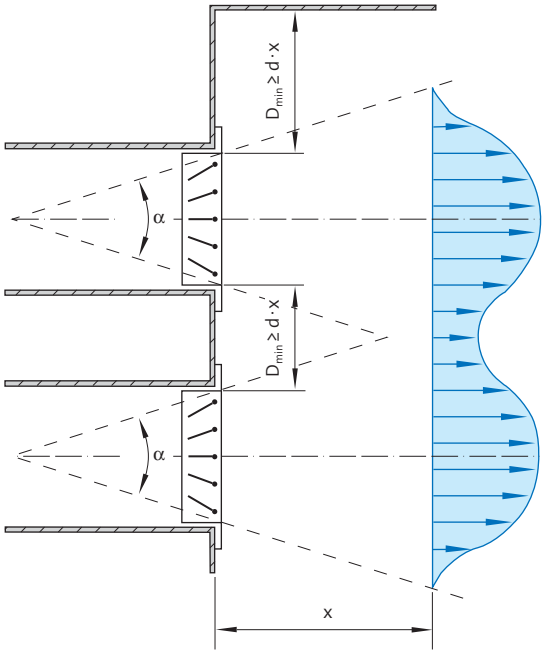
Example

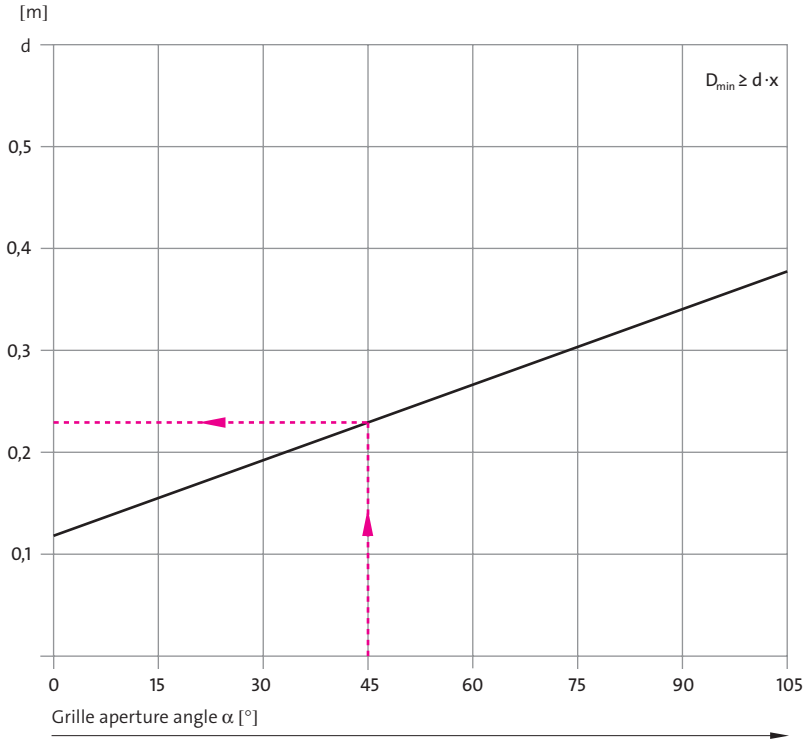
Given: ***An airflow path of x = 10 m with a velocity of $v_{x\,max}$ = 0,4 m/s.***

Required: *Distance from the airflow axis (open jet) or ceiling (ceiling airflow) at which v = 0.2 m/s.*

Solution: *Find the airflow path x = 10 m and the point at which the vertical line from this meets the diagonal line representing $v_{x\,max}$ = 0,4 m/s. From this point, follow the line along to the vertical axis on the left $y_{0,2}$.*

Rating diagrams





Minimum spacing of grilles

If the gaps between the individual grilles is less than D_{min}, then the outflows which are emitted can be concentrated into a single airflow and achieve a greater range than that of an individual grille.
If the gap D_{min} of a grille to a side wall or ceiling is undershot then the outflow will also be spread and achieves greater ranges.

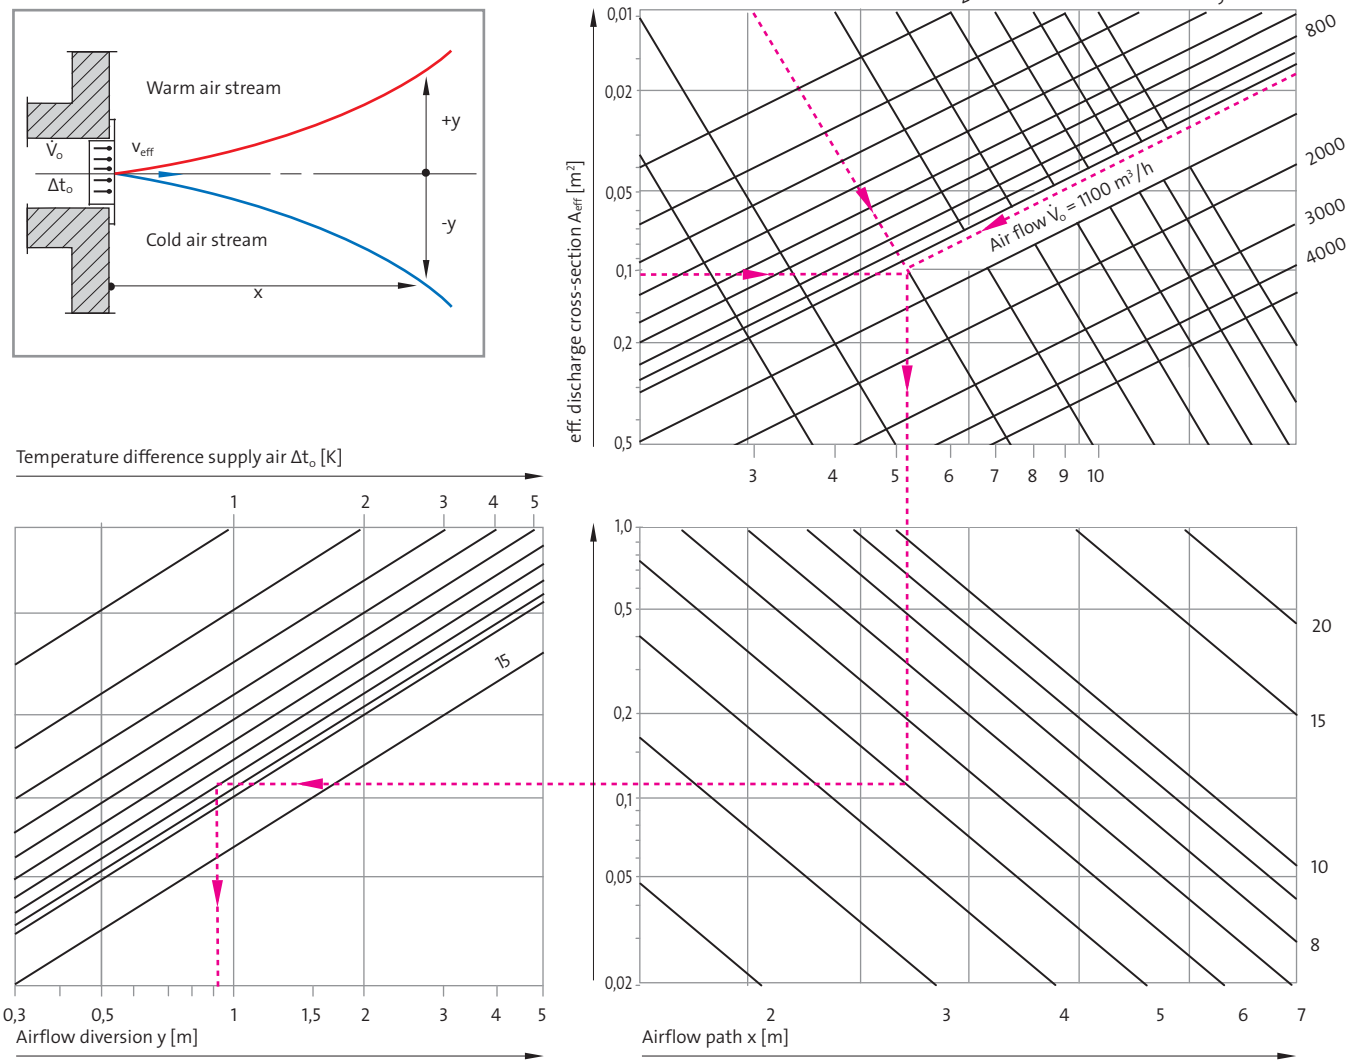
Example

If, in the case of a grille aperture angle of α = 45°, the airflow paths of neighbouring individual airflows x = 7 m, but the airflows are not concentrated into a single airflow, then it is necessary to select a minimum gap of $D_{min} \geq 0{,}23 \times 7 \geq 1{,}6$ m between the grilles.

Rating diagrams

Vertical airflow diversion y (m) due to temperature differences

The open jet characteristics described in the selection diagrams generally only apply to isothermal airflows.
The non-isothermal open jet that is blown in horizontally is diverted in a vertical direction by lifting and descending forces which are caused by the temperature differences between the stream air and the room air.



Example

Given: ***Individual grille where A_{eff} = 0,1 m², v_{eff} = 3 m/s (or. $\dot{V}_o$ = 1100 m³/h), airflow path x = 5 m nd supply air temperature difference Δt_o = 8 K.***

Required: *Airflow diversion y [m]*

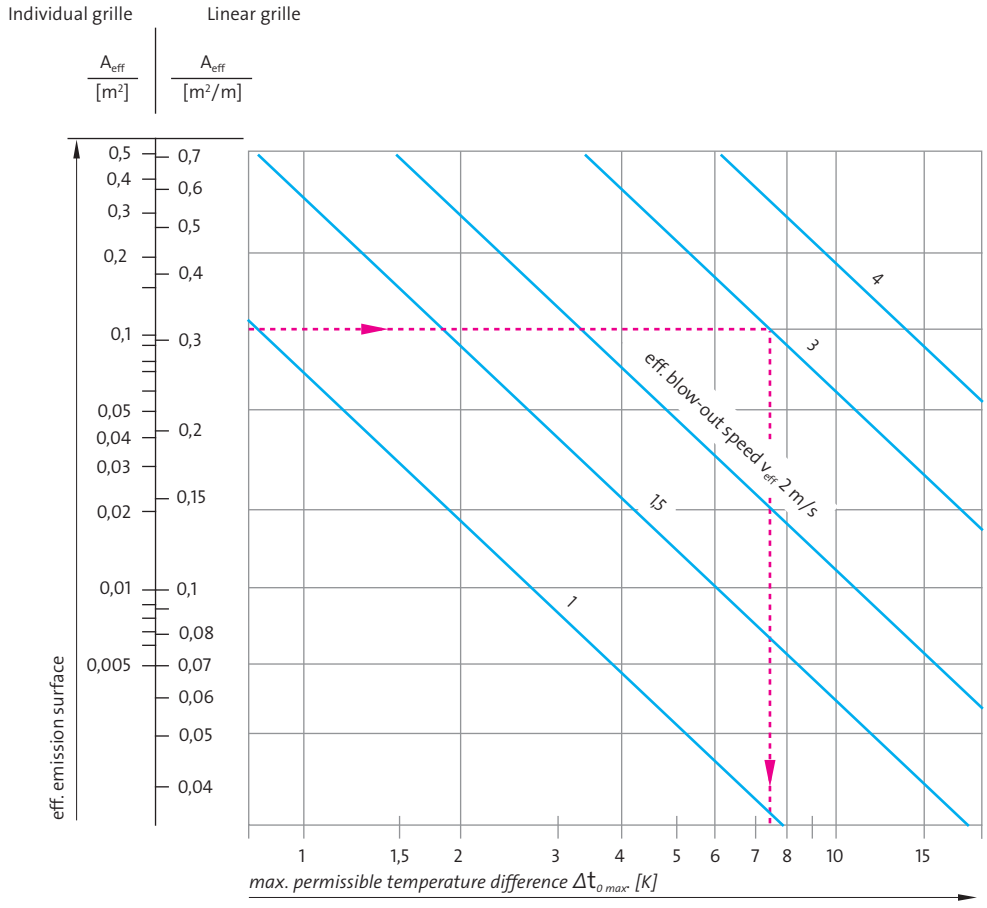
Solution: *Find the A_{eff} -value of 0.1 m². From this point, go horizontally to the right until you reach the point of intersection with the line representing v_{eff} = 3 m/s or $\dot{V}_o$ = 1100 m³/h, and then down vertically until you reach the point of intersection with the line x = 5 m. From this point, go horizontally to the left until you find the point of intersection with the line for Δt_o = 8 K. The airflow diversion value of 0.9 m is located vertically underneath the point of intersection.*

Note:
In the case of grilles with slats angled in different directions, the airflow diversion y changes in relation to grille aperture angle α; $y = y_{Diagr.}/C$.

Rating diagrams

Descent of the ceiling airflows during the cooling operation

Cold air streams, that are blown in immediately below the ceiling, only adhere to the ceiling if the temperature difference $\Delta t_{0\,max}$ (temperature difference between the incoming air and the room air) that can be read from the adjacent diagram is not exceeded.



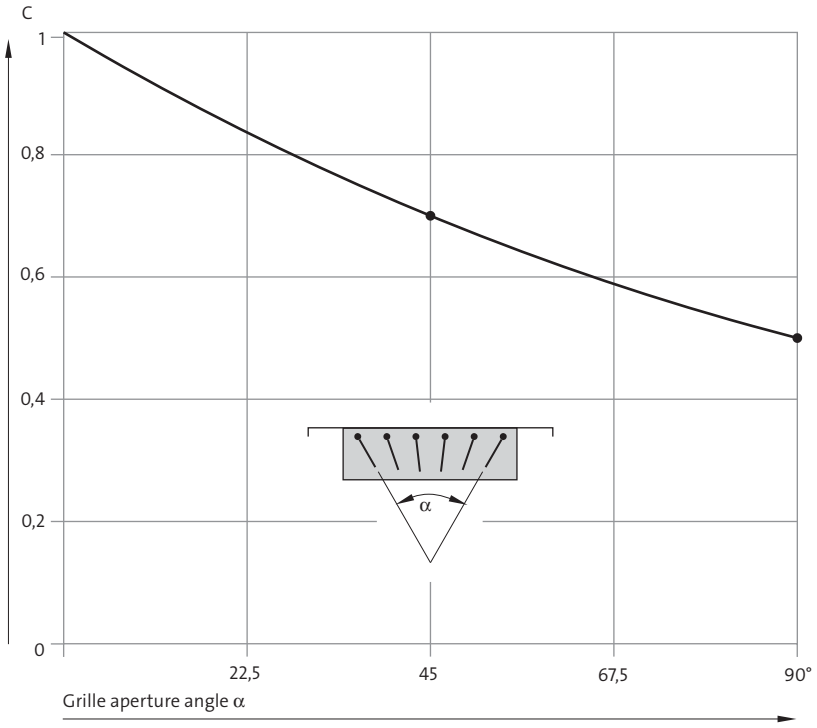
Example

Given: ***Individual grille where A_{eff} = 0.1 m², v_{eff} = 3 m/s***

Required: *Maximum permissible difference in temperature $\Delta t_{0\,max}$ between supply air and room air, at which the airflow adheres to the ceiling.*

Solution: *Find the A_{eff} -value for an individual grille of 0.1 m². From this point, go horizontally to the right until you reach the point of intersection with the line representing v_{eff} = 3 m/s. The max. permissible temperature difference $\Delta t_{0\,max}$ of 7.5 K is located vertically underneath this point.*

Rating diagrams



If the slats of a grille are set so that they diverge then various different layout parameters change:

Induction: $i_\alpha = i_{Diagram} / C$

Temperature ratio:
$\Delta t_{xmax} / \Delta t_0 = C \cdot x \cdot (\Delta t_{xmaxDiagram} / \Delta t_0)$

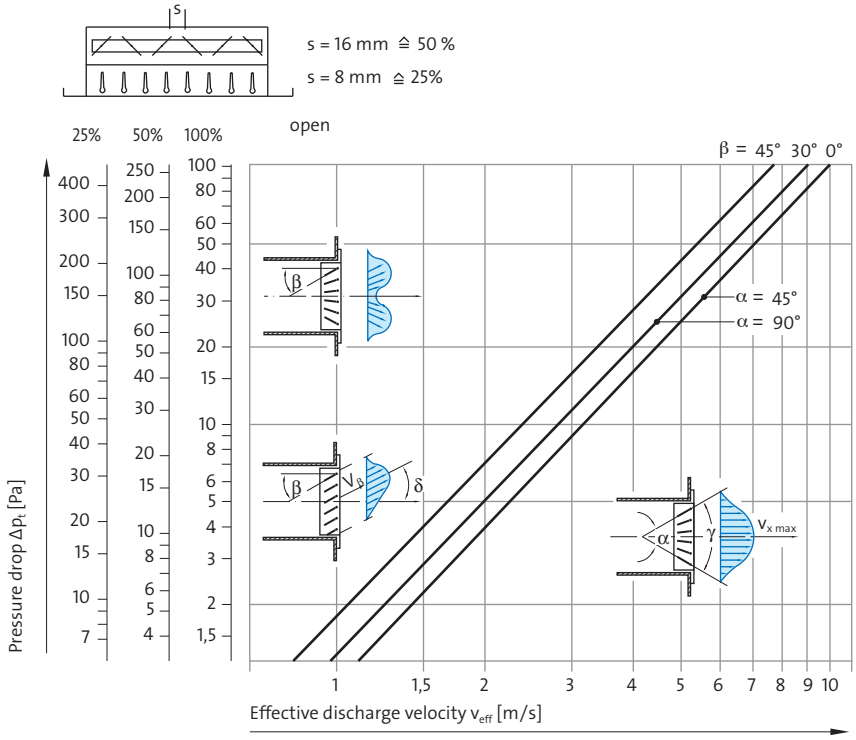
Velocity: $v_{xmax} = C \cdot x \cdot v_{xmaxDiagram}$

The acoustic power level L_{WA} is increased by

ΔL = 1 dB (A) at α = 45°

ΔL = 3 dB (A) at α = 90°

Pressure drop for grilles with flow rate damper, airflow division and airflow spread



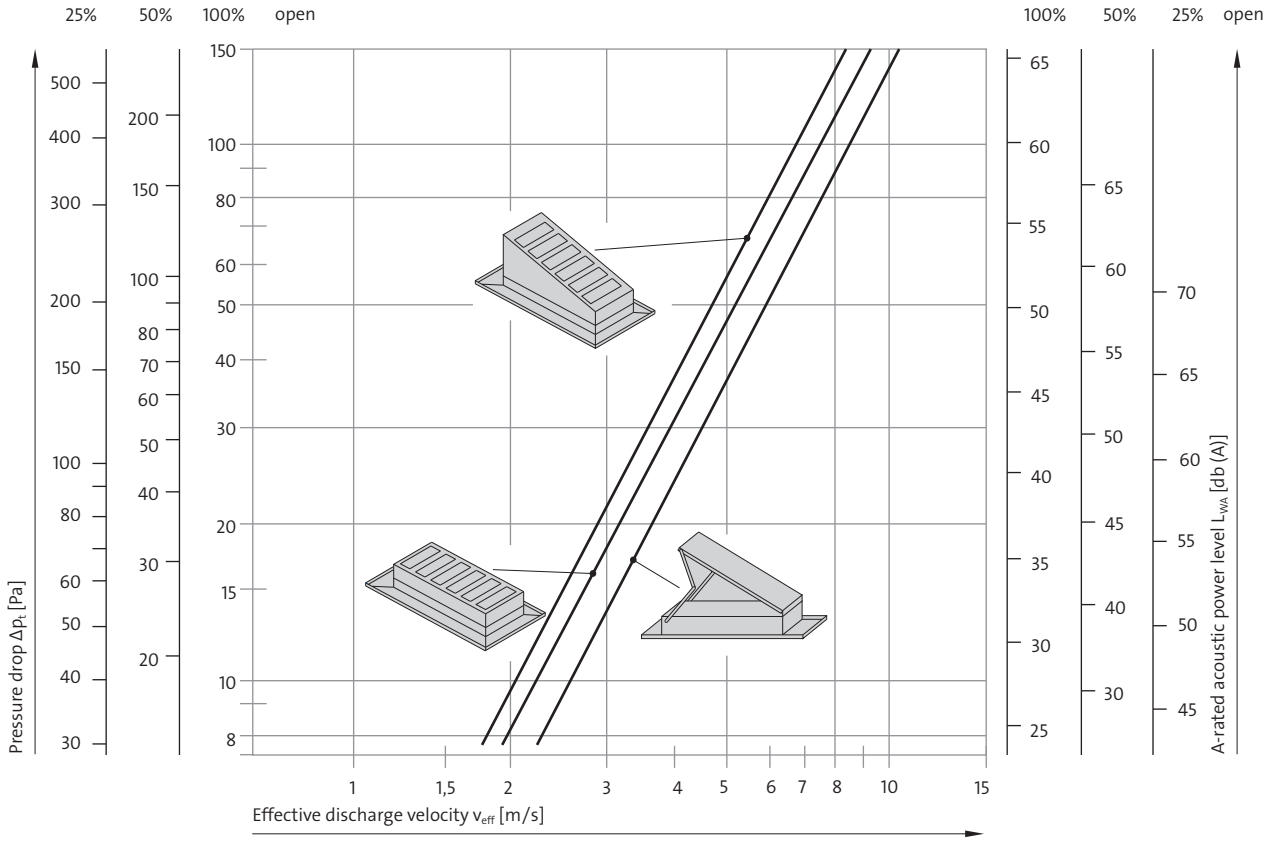
This diagram can be used to determine the pressure drop level for grilles with a flow rate damper as well as the pressure drop level that results from airflow diversion and airflow spread.

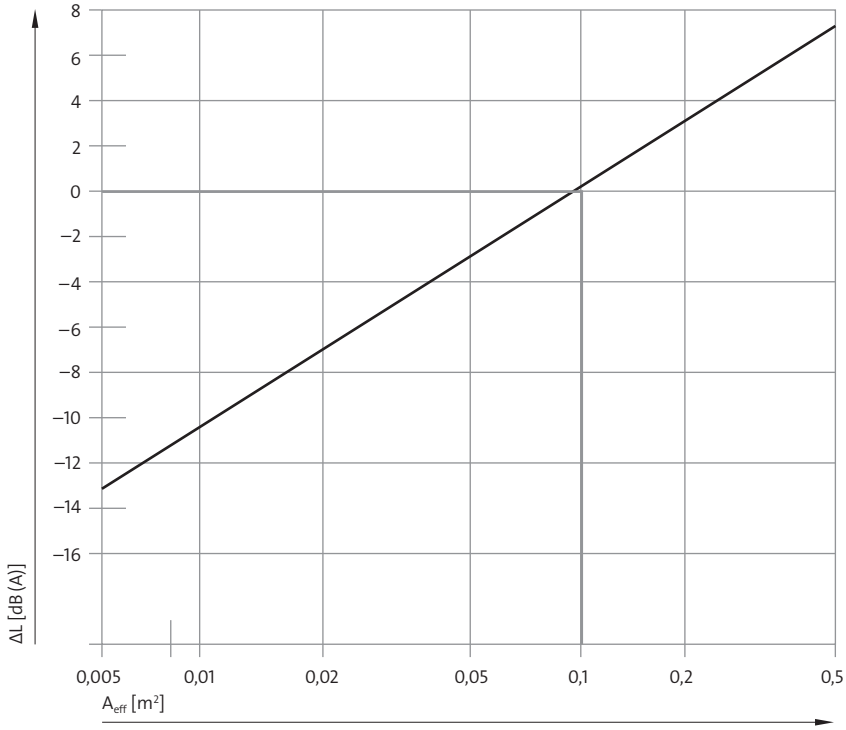
Grille aperture angle α	45°	90°
Airflow aperture angle γ	40°	70°

$v_\beta = K \cdot x \cdot v_{eff}$ $\qquad v_{eff} = \frac{\dot{V}_o}{A_{eff}}$

Rating diagrams

Pressure drop and acoustic power level for grilles with volume control



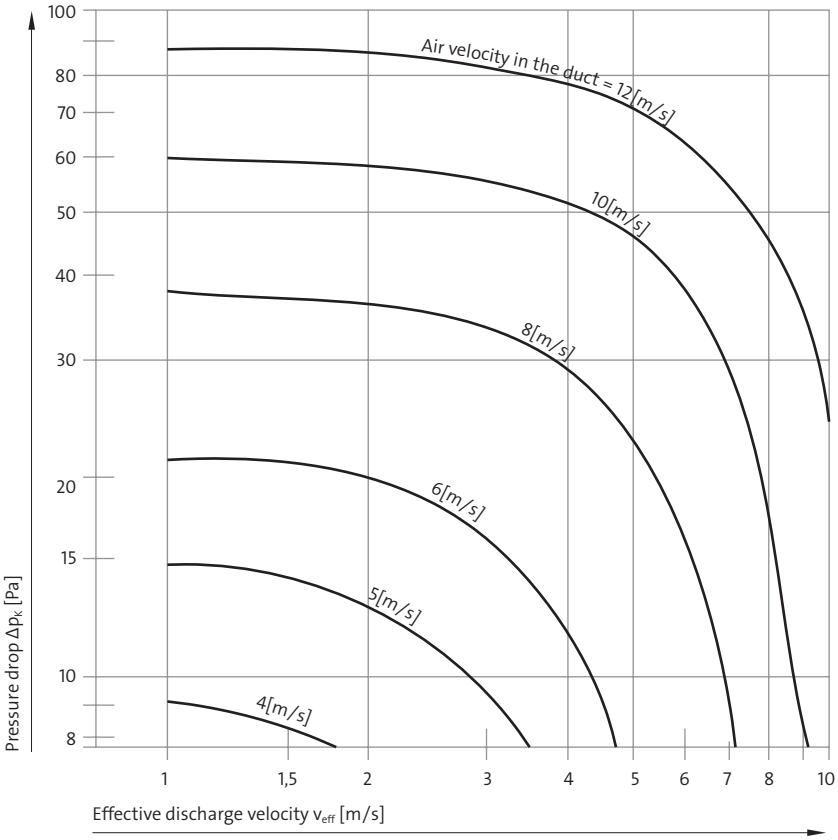


Acoustic power levels listed in above diagram $L_{WA\ Diagram}$ are valid for grilles with an effective discharge cross-section of A_{eff} = 0.1 m².
Grilles with other discharge cross-sections can be determined with the following equation:

$L_{WA} = L_{WA\ Diagr.} + \Delta L$

Rating diagrams

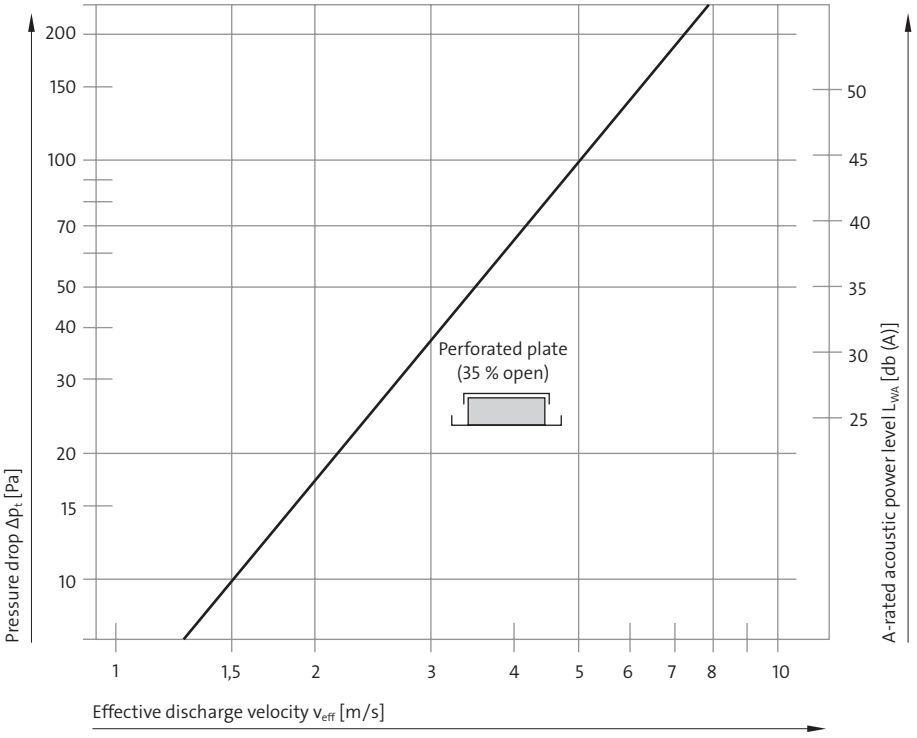
Pressure drop



If the air speed in the conduit is greater than the blowout speed v_{eff} then the pressure drop is increased in accordance with the following equation:

$\Delta p_t = \Delta p_{t\ Diagram} + \Delta p_K$

Pressure drop and acoustic power level for grilles with perforated plate



Individual grilles without ceiling effect

The values in the chart are valid for individual grilles without ceiling or wall effect and a grille opening angle of $\alpha = 0°$.

Make the following corrections for grilles with ceiling or wall effect or with other opening angles:

$v = v_{Diagram} \cdot 1.4$

$\Delta T_{xy}/\Delta T_0 = (\Delta T_{xy}/\Delta T_0)_{Diagram} \cdot 1.4$

$i = i_{Diagram} \cdot 0.7 \quad i = \dot{V}_{xy}/\dot{V}_0$

$x = x_{Diagram} \cdot 0.5 \quad$ at $\alpha = 45°$

$x = x_{Diagram} \cdot 0.35 \quad$ at $\alpha = 90°$

The following is valid for linear grilles:

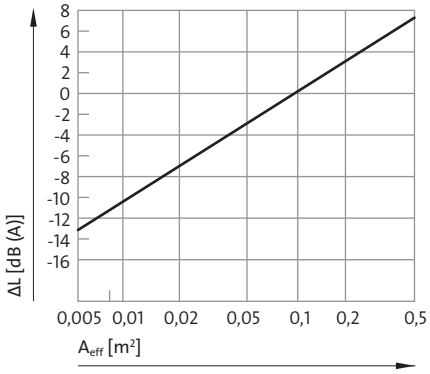
$v_{Band} \cong 0.5 \cdot \sqrt{x} \cdot v_{Grille}$

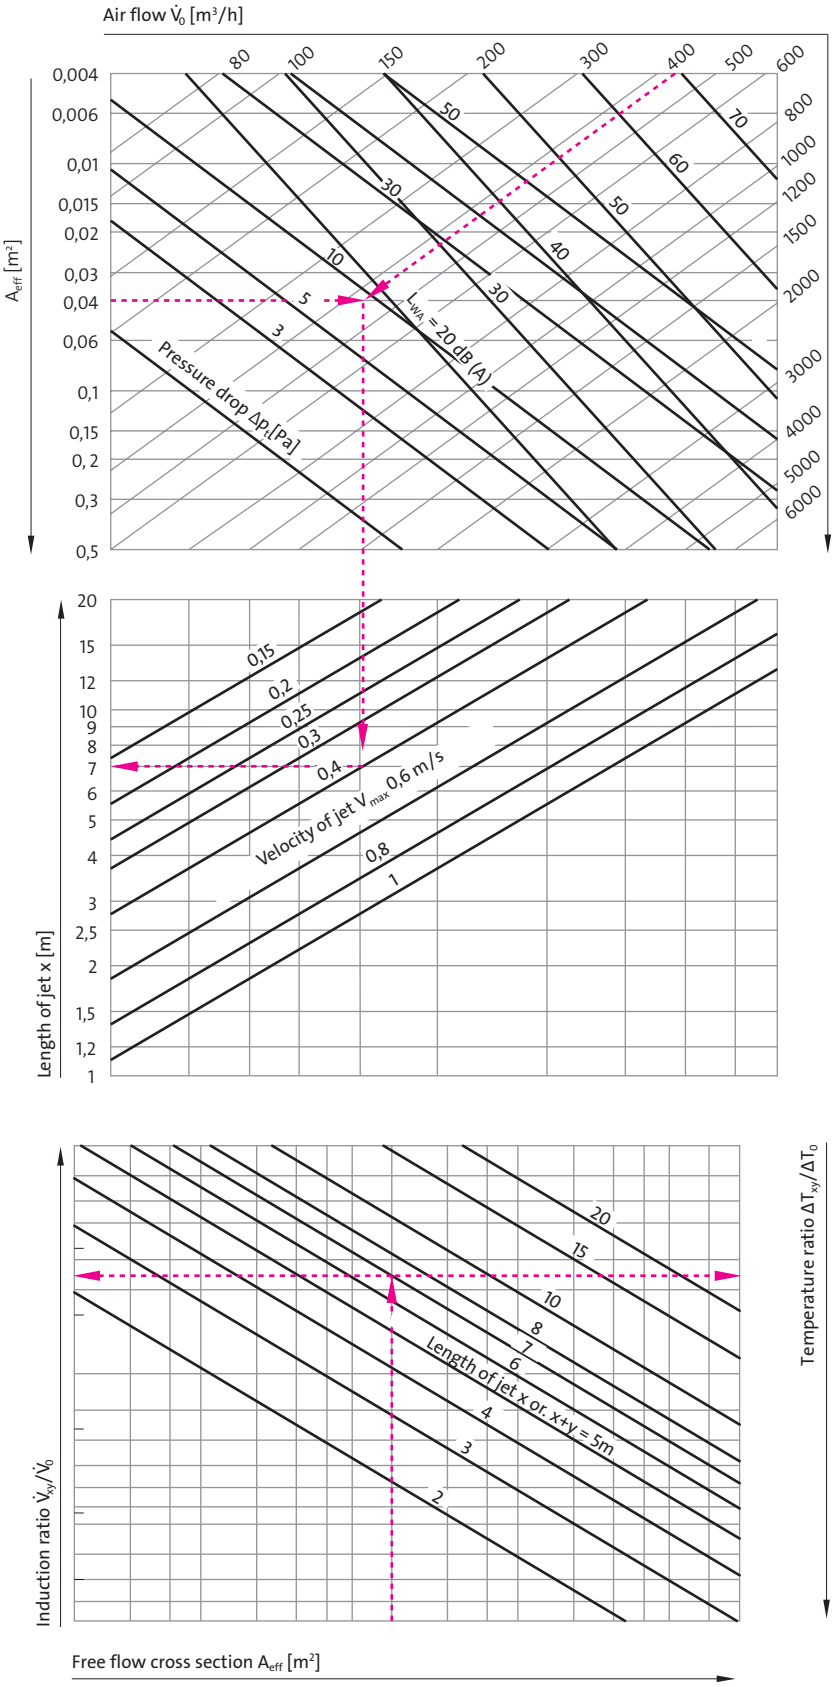
$i_{Band} \cong 1.7 \cdot 1/\sqrt{x} \cdot i_{Grille}$

Sound power level for grilles with a discharge cross-section which deviates from $A_{eff} = 0{,}1\ m^2$ can be determined with the following equation:

$L_{WA} = L_{WA\ Diagram} + \Delta L$

Please refer to the chart below for the correction value ΔL.





Ceiling Diffuser G 352
Made of aluminum with natural anodized finish (E6C0). Has fixed blades and frame. Standard attachments in galvanized material with black baked finish, galvanized steel plenum box.
Fixing without a plenum box is done via a central screw in combination with a mounting element for duct spigots (central hole is standard), or with four screws in the frame. Please indicate option when ordering.

Heavy External Weather Resistant Grille G 463

Heavy external weather resistant grille of galvanized material with a rear-mounted wire mesh guard. Approximately 58% free cross-section (based on W x H). Also available as linear grille.

Installation

Recessed holes for screw mounting in the frame and/or galvanized subframe with wall anchor (factory norm).
When using the subframe:
H + 30 mm and W + 30 mm.

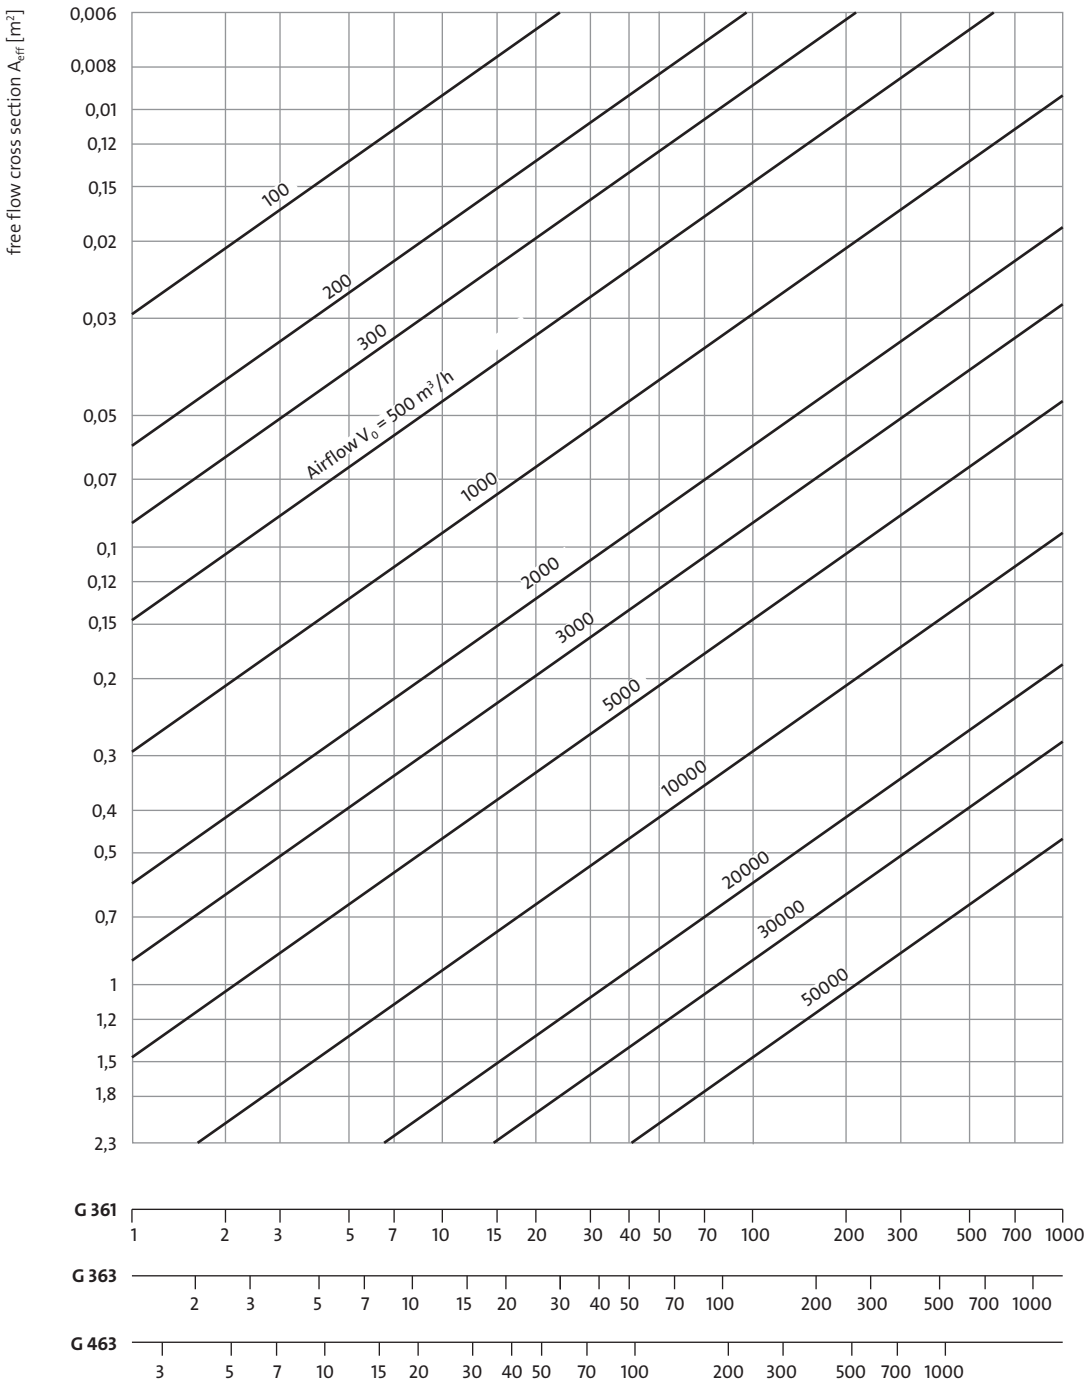
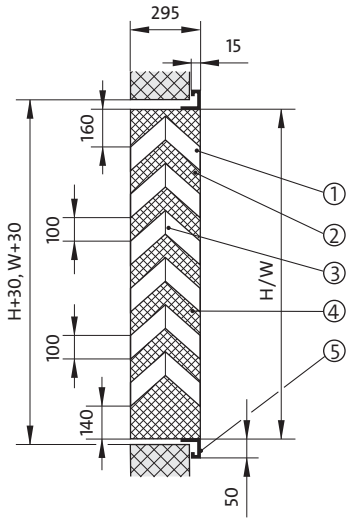
G 361/G 363/G 463 - Rating diagram



Calculate the effective flow cross section:

G 361: A_{eff} [m²] = W [mm] x (H - 25) [mm] x 0.49 x 10^{-6}
G 363: A_{eff} [m²] = W [mm] x (H - 82.5) [mm] x 0.60 x 10^{-6}
G 463: A_{eff} [m²] = W [mm] x (H - 66) [mm] x 0.58 x 10^{-6}



① Blade
② Perforated plate (not applicable with melamine filling)
③ Wire mesh / gutter
④ Filling: mineral wool or melamine
⑤ Surrounding angle flange 50 x 50 x 3 (accessories)

Sound-attenuating external grille SWG

Sound-attenuating external grille SWG consists of a sendzimir galvanized steel plate with sound-attenuating mineral wool or plastic (melamine), covered with glass fibre, a perforated metal plate and an integrated wire mesh guard. Available upon request in aluminium, stainless steel or a painted finish (RAL).

Areas of Application

This grille is suitable for use in all applications where high sound-attenuation, low flow resistance and minimal penetration depths are required:

- Supply and exhaust air openings in air conditioning systems in building shells
- Machine and other technical rooms
- Sound-insulated booths and housing
- Ventilation openings in circuit / distribution stations
- Boiler houses
- Car parks
- As a shield in refrigerated warehouses and condenser units

SWG is best used in situations with air velocities of up to 1.0 m/s (based on area H x W).

Sound-attenuating External Grille Model SWG – acoustic power level
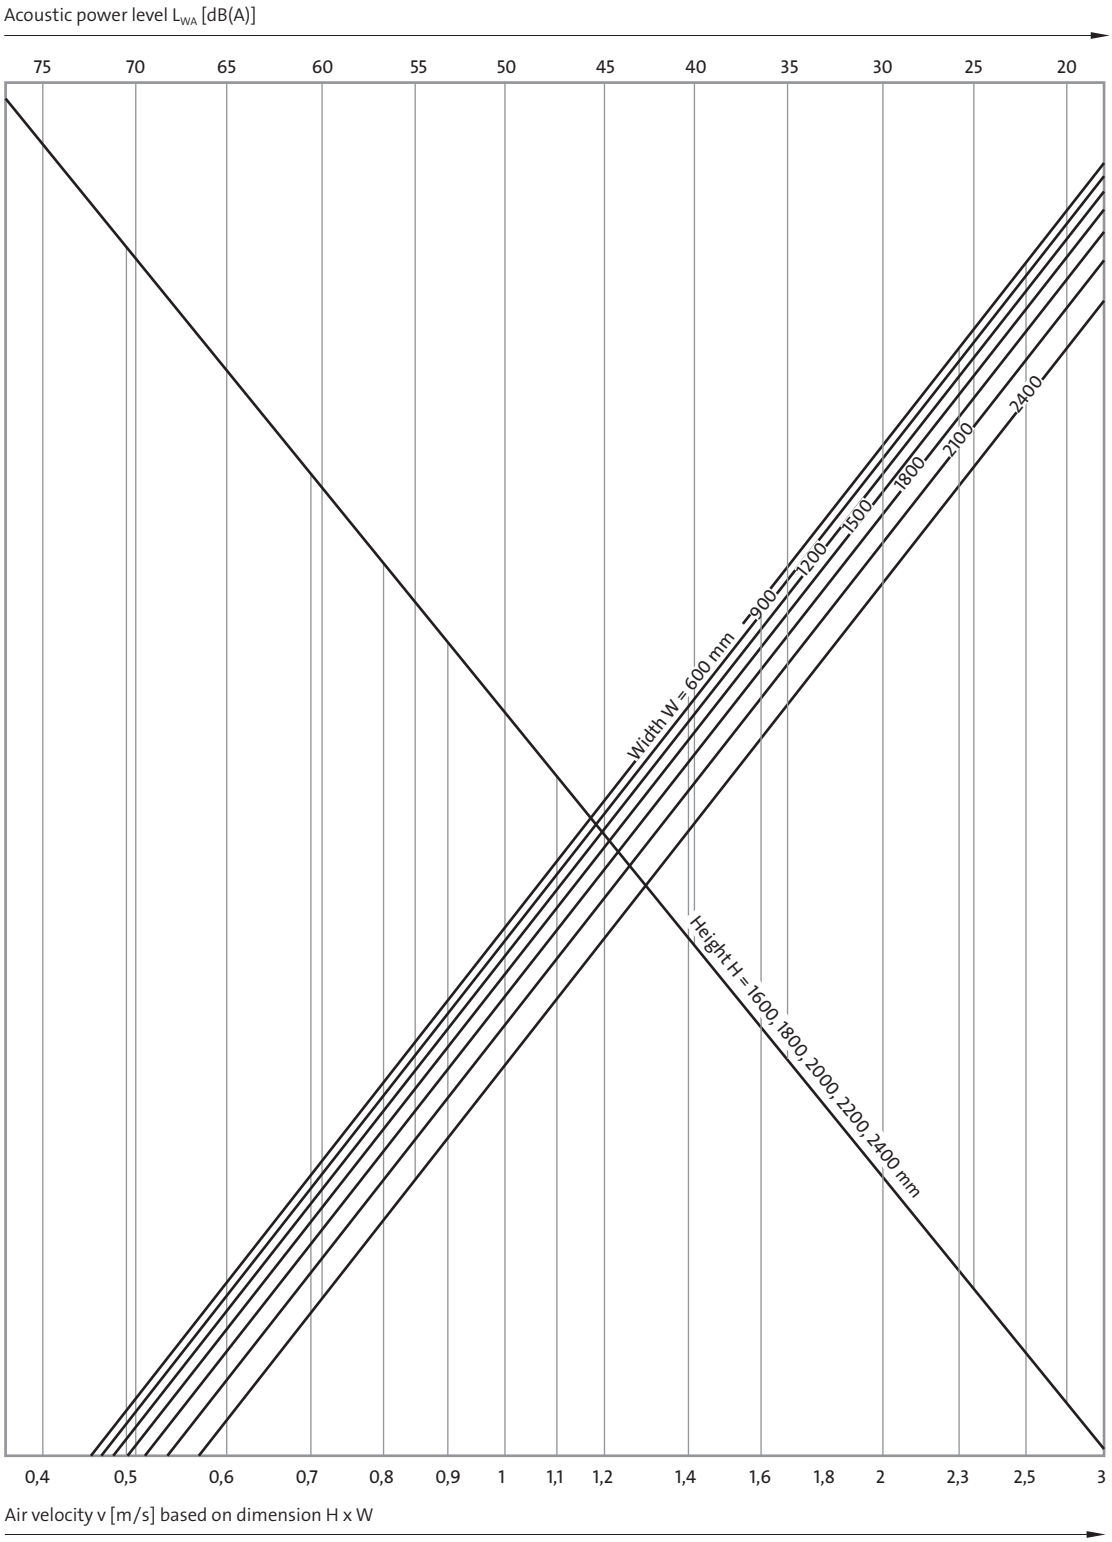
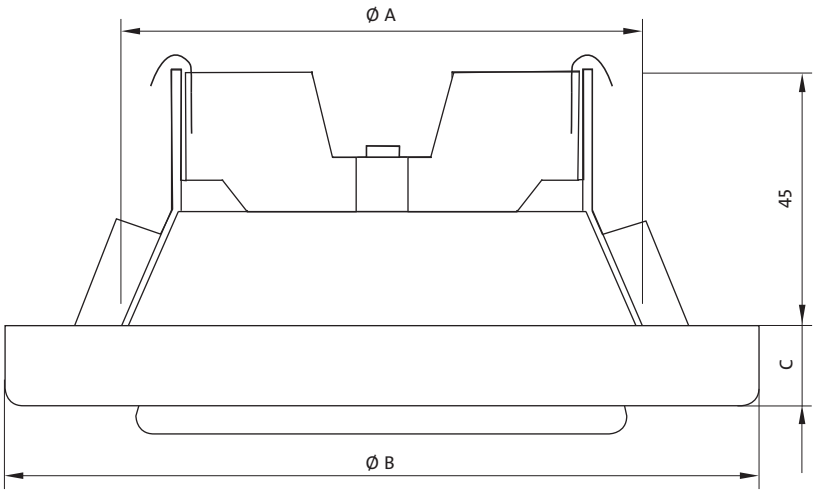
Height of the grids: 1.6 m – 2.4 m



Disc Valve ALV
Disc valve ALV is suitable for use in all types of ventilation systems. It consists of a wedge-shaped inlet with inlet ring for wall mounting as well as a closable valve cone. The disc valve is made of powder-coated sheet steel (RAL 9010). ALV can generally be clipped directly onto the duct. An installation ring is necessary for size DN 200, but is optional for all other sizes.

Volume flow setting
Rotating the central disc changes the A spacing. Please refer to the design graphs for the correlation between pressure drop and volume flow in various central disc positions.



Nominal size DN	80	100	125	160	200
Dimension Ø A [mm]	80	100	125	160	200
Dimension Ø B [mm]	106	135	160	194	238

The Company

The Erwin Müller Group based in Lingen, Germany, is a company which, since being founded in 1945, has stood out thanks to its consistent growth, expertise and innovation.

Its wealth of ideas, entrepreneurial skills and partnership approach with employees form the basis for the company's continuous positive development trends. An unmistakeable feature of all the products manufactured under the EMCO and NOVUS brand names is the synthesis of practical benefits and exemplary designs.

It is this product quality in terms of both style and function that is helping the company to sustain its global market presence in the new millennium.

emco Bau- und Klimatechnik GmbH & Co. KG
